Site_2: Not I; The library was constructed according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806,
1996. Denatured mRNA was size fractionated on a 1% agarose gel. First strand cDNA, synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded cDNA was size selected according to mRNA size fraction,
ligated with EcoR I adaptor, digested with Not I, and then cloned directionally into pYX-Asc vector. The library tag sequence located between the Not I site and the polyA tail, is TGACAGAGCC. This library was created for the University of Iowa Mouse Brain Molecular Anatomy Project (BMAP): 'Gene Discovery in the Developing Mouse Nervous System', supported by National Instututes of Mental Health (NIMH), Hemin Chin, Ph.D., program coordinator."

## SUMMARIES

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The invention also provides TSPAN-7 polypeptides and polynucleotides. TSPAN-7 inhibitors are useful for inhibiting proliferation of mammalian cells, including tumour cells, for decreasing the side effects of cancer therapy and for treating neoplastic diseases. They are used to modulate TSPAN-7 expression and function in cancer cells, particularly in prostate cancer cells. They are also used in antisense therapy. The present sequence is human TSPAN-7 protein encoding cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New inhibitor of tetraspan protein useful for reducing the expression or activities of tetraspan protein in cells, and for treating a hyperproliferative disorder, especially cancer in a mammal .

                                                                                                                                                                                                                                                                                  Sequences AAA93616-A93631 and AAA93675 represent nucleic acids which encode human SECX proteins (AAB23029-B23048). The SECX proteins CC of the invention are either secreted or membrane-associated proteins CC and act as regulator of cellular proliferation and differentiation. SECX proteins or nucleotides are useful for diagnosing the presence of, or CC proteins and nucleotides. The SECX proteins are also useful to screen CC compounds that modulate SECX activity or expression. The interaction of CC a SECX protein with other cellular proteins may be useful to modulate CC differentiation and cell survival. SECX nucleotides are useful for the CC recombinant expression of SECX protein, and may be useful to modulate CC excides equences are also useful for the CC acid sequences are also useful for the CC secX expression (e.g., using antisense oligonucleotides). SECX nucleic cuseful for detecting the presence of SECX nucleotides are useful for tissue type in CC useful for detecting the presence of SECX nucleotides and for screening CC tissue cultures for contamination. Diseases that may be treated or prevented using SECX proteins or nucleotides and for screening CC including autoimmune diseases, transplant rejection, allergies, AIDS), concluding autoimmune diseases, transplant rejection, allergies, AIDS), concurological diseases (e.g., Alzheimer's disease), trauma (e.g., catiosorders, cational concluding spinal conditions, and skeletal ccc disorders.
                                                                                                                                      DЬ
                                                                                                                                                                      γ

ANZ65250 to ANZ65350 represent 97 isolated human secreted protein genes. This sequence was found to be present on human chromosome 10.

ANX76124 to ANX76223 represent the secreted proteins encoded by the 97 human genes. The genes and their corresponding secreted polypeptides are useful for preventing, treating or ameliorating medical conditions, e.g. by protein or gene therapy. Also pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the 97 genes, based on which tissues they are most highly expressed in, and include developing products for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; secreted protein; cancer; tumour; developmental abnormality; foetal deficiency; blood disorder; immune system disorder; inflammation; autolamune disease; ellergy; Alzheimer's disease; cognitive disorder; schizophrenia; arthritis; asthma; psoriasis; sepsis; skin disorder; atherosclerosis; diabetes; cardiovascular disorder; kidney disorder; digestive disorder; endocrine disorder; infection; AIDS; leukaemia; therapy; chromosome 10; ds.

CC The invention relates to novel secreted/transmembrane proteins, and CC nucleic acids encoding them. The novel proteins are designated TANGO 339, CC TANGO 353, TANGO 358, TANGO 365, TANGO 368, TANGO 369, TANGO 383, TANGO CC 393, TANGO 402, MANGO 346 and MANGO 349 and are of human origin, and a CC murine TANGO 393 is also included within the scope of the invention. The CC invention also encompasses fragments and variants of the proteins of the invention and nucleic acids encoding them. The invention additionally CC relates to host cells comprising a nucleic acid of the invention; methods (CC for the production of a protein of the invention; and nutleous specific CC for a protein of the invention; and methods for detecting a protein or CC nucleic acid of the invention; and methods of identifying agents which CC bind to or modulate the activity of a protein of the invention. The novel CC secreted proteins, nucleic acids encoding them, and antibodies against them may be used in the prevention, diagnosis and treatment of diseases CC associated with inappropriate expression or activity of the secreted proteins. The secreted proteins. The secreted to compression or activity, which may be useful in CC invention e.g., cancers and immunological disorders. The present CC invention e.g., cancers and immunological disorders. The present CC sequence represents CDNA encoding human TANGO protein of the invention.
